

1. HTTP allows the requests and responses to be treated independently due to it being a stateless protocol. This means the server doesn't remember a user in between requests. Web applications are different because they use system management, which allows multiple requests per user. Servers can also create sessions for the user, like cookies, which creates a session ID for the user. This allows HTTP applications to preserve the state of an application across multiple request-response cycles. For example, when a user logs in, the server verifies their username and password and creates a session containing information such as the user's identity and authentication status. The server will then send the unique session ID through a browser cookie. A later request will send this cookie back to the server, preserving the information. For security, cookies will usually be protected and most applicants will use HTTPS to protect session information. Session IDs will also regenerate after authentication to help protect the user.
2. Django database migrations allow Django models to apply changes to a database. If you want to migrate a Django application to a relational database, MariaDB would be a suitable option. You would first have to create a MariaDB database and then configure the database settings in Django to connect to it. After the database connection has been configured, you can create or modify the model so that, when you migrate, Django can detect changes in the model and create a migration file that includes the required database changes. You can then apply the migrations to the MariaDB database, which will allow you to create the required tables and fields. When applying this to a server, the migration files and the application should be transferred while the migration runs against the server database. This will ensure that the server remains consistent with the Django models. Overall this is a reliable way to manage database changes and ensure that the Django application and the database work together correctly.
